

1 **ABSTRACT**

2 Systems and methods for processing dynamic content are described herein.
3 A system receives a request for content that includes an item cached by a proxy.
4 The system issues another request to a content server to generate the other items
5 that are not cached, without disrupting the process workflow of the original
6 request. The system combines the items generated by the content server with the
7 item cached by the proxy and sends the combined content to a destination.
